

Spotify 2023 Music Streaming Performance Dashboard

A structured report based on the Power BI dashboard and visual evidence provided in the source PDF.

Report focus	Spotify streams, playlist exposure, chart presence, Shazam activity, artist count, musical attributes, and BPM analysis.
Tool	Microsoft Power BI Desktop
Source	Provided Power BI dashboard PDF (6 pages)

Prepared as a formal academic-style dashboard analysis report

1. Acknowledgment

I would like to express my sincere appreciation to the academic and practical learning environment that supported the completion of this Power BI dashboard analysis. The report is based on the provided Spotify dataset visualization and the accompanying Power BI dashboard pages. The visualizations made it possible to examine streaming performance, playlist exposure, chart presence, Shazam activity, artist participation, musical characteristics, and BPM-related patterns in a structured way.

I also acknowledge the value of Power BI as a business-intelligence tool for turning raw data into interactive visual summaries that can support interpretation and communication of analytical results.

2. Abstract

This report presents an analysis of a Spotify music dataset through a Power BI dashboard. The dashboard reports an overall total of approximately 489 billion Spotify streams and examines relationships between streams and Spotify playlist exposure, artist count, Spotify chart presence, Shazam chart presence, musical attributes, and BPM ranges. It also provides major-versus-minor comparisons for streams, danceability, energy, valence, acousticness, and BPM. In addition, the dashboard identifies highly exposed tracks and tracks with strong Shazam presence. The report interprets the visual patterns shown in the six dashboard pages and summarizes the major and minor findings without introducing data that is not supported by the supplied dashboard.

3. Dashboard Overview

The supplied Power BI dashboard contains six analytical pages. Together, the pages move from an overall streaming and playlist overview to artist-count analysis, playlist and cross-platform chart exposure, Shazam performance, major-versus-minor musical analysis, and BPM-based analysis.

Page	Main analytical focus	Key visible measures / outputs
1	Overall Spotify performance	489bn total streams; playlist and chart averages; release-year filter; playlist exposure vs
2	Artist-count analysis	Average streams, Spotify playlist presence, Spotify chart presence, and selected track-l
3	Playlist exposure	Spotify playlist exposure vs chart presence; top 10 songs by Spotify playlist exposure; c
4	Shazam performance	Streams and Spotify playlist exposure by Shazam presence; top 10 Shazam songs; plat
5	Major vs Minor	Average streams, danceability, energy, valence, acousticness, and BPM by mode
6	BPM analysis	Song count, average streams, playlist exposure, Spotify chart presence, and BPM vs to

4. Chart Performance Analysis

The dashboard uses several chart types to communicate different analytical questions. The performance below refers to how the charts function as analytical views within the provided dashboard, not to a software-speed benchmark.

4.1 Overall streaming and exposure charts

Page 1 combines KPI cards with a column-style relationship chart. The 489bn total-stream KPI gives an immediate headline measure, while the Spotify playlist exposure versus streams visual shows how stream totals vary across different levels of playlist exposure. The release year slider provides an interactive filtering dimension.

4.2 Artist-count charts

Page 2 uses grouped bar charts to compare average streams, playlist presence, and Spotify chart presence across artist counts. These charts make differences between artist-count categories easy to compare. The accompanying table adds track-level detail for selected well-known songs, including Blinding Lights, Shape of You, and Someone You Loved.

4.3 Playlist and cross-platform charts

Page 3 combines a distribution-style bar chart with a ranked top-10 horizontal bar chart and a cross-platform comparison table. The ranked chart clearly highlights playlist exposure, while the table shows that high Spotify playlist exposure can coexist with different levels of Apple and Deezer chart presence.

4.4 Shazam charts

Page 4 connects Shazam chart presence with average streams and Spotify playlist exposure, then provides a top-10 Shazam chart view. The platform-performance table adds artist and track context. This page is useful for examining discovery-oriented signals alongside streaming.

4.5 Major/minor and BPM charts

Pages 5 and 6 use consistent bar-chart layouts for musical attributes and BPM ranges. This consistency makes category comparisons straightforward. The BPM page additionally uses a scatter plot for BPM versus total streams, which is appropriate for examining the relationship between two numeric measures.

5. Major and Minor Analysis

The major/minor comparison on page 5 evaluates six measures: average streams, danceability, energy, valence, acousticness, and BPM. The dashboard's bars show that the two modes have different profiles across these dimensions, although the differences are not equally large for every measure.

Measure	Dashboard observation
Average streams	The Major bar is visibly higher than the Minor bar, indicating higher average streams for Major tracks.
Danceability	The Minor bar is slightly higher than the Major bar.
Energy	The two bars are very close, with Minor appearing slightly higher.
Valence	Minor is visibly higher than Major, indicating a higher average valence in the supplied visualization.
Acousticness	Major is visibly higher than Minor.
BPM	The two mode averages are close, with Major appearing slightly higher in the dashboard.

Interpretation: the dashboard suggests that musical mode is associated with differences in the observed audio-feature averages, but the charts alone do not establish causation. They describe the dataset's observed averages rather than proving that musical mode causes higher or lower streaming performance.

6. Key Findings

The following findings are directly supported by the supplied dashboard pages:

1. The dashboard reports approximately 489 billion total Spotify streams.
2. Average Spotify playlist exposure is shown as about 5.20K, while the average values shown for Apple playlists, Deezer playlists, Apple charts, Spotify charts, Deezer charts, and Shazam charts are 67.87, 385.54, 51.96, 12.02, 2.67, and 60.06 respectively.
3. Playlist exposure and streaming are not represented as a simple one-to-one relationship; page 1 shows substantial variation in streams across playlist-exposure levels.
4. Page 3 identifies Get Lucky - Radio Edit as the highest Spotify-playlist-exposure track among the displayed top-10 list, followed by Mr. Brightside and Wake Me Up - Radio Edit.
5. The cross-platform table shows different patterns across Spotify, Apple, and Deezer chart measures. For example, Blinding Lights has 43,899 Spotify playlists, 69 Spotify charts, and 199 Apple charts in the displayed table.
6. Page 4 identifies Makeba, Daylight, What Was I Made For?, MONTAGEM - FR PUNK, Barbie World, Popular, Flowers, fukumean, The Next Episode, and vampire among the displayed top Shazam tracks.
7. The major/minor page shows visible differences in average streams and several audio features, while energy and BPM appear comparatively close between the two modes.
8. The BPM analysis shows that the dataset contains many tracks concentrated in a middle BPM range, while the scatter plot demonstrates wide variation in total streams across BPM values.

7. Major Findings vs Minor Findings

Major findings	Minor / supporting findings
Very high overall streaming volume: 489bn total Spotify streams	Average platform exposure measures provide additional context but are not as detailed as the release year chart
Spotify playlist exposure is strongly represented throughout the data	The release year chart indicates that streaming and chart analysis as an analytical tool is not as detailed as the release year chart
Top playlist-exposure and Shazam charts identify specific tracks with strong platform visibility	Artist-level streaming and playlist/chart measures across all platforms
Major/minor mode shows visible differences in streams and Shazam counts	SPM average musical features in song counts, playlist exposure, and chart

8. Conclusion

The Power BI dashboard provides a multi-dimensional view of Spotify music performance. It combines headline KPIs, comparative charts, ranked song lists, cross-platform measures, audio characteristics, and BPM analysis into a single analytical framework. The reported 489bn total Spotify streams establish the scale of the dataset, while the other pages show that streaming performance can be examined from several complementary perspectives, including playlist exposure, artist count, chart presence, Shazam activity, musical mode, and tempo.

Overall, the dashboard is effective for exploratory business-intelligence analysis because it moves from summary-level indicators to detailed comparisons. The major/minor and BPM pages also demonstrate how descriptive audio features can be incorporated into a streaming-performance analysis. The results should be interpreted as descriptive patterns in the supplied dataset; the visualizations do not by themselves establish causal relationships.

9. Appendix — Original Dashboard Pages

The following pages reproduce the original PDF dashboard pages as images so that the submitted report retains the complete visual evidence supplied with the assignment.
